

Epilepsy is a neurological disorder, diagnosed when a person has two or more unprovoked seizures. It is commonly referred to as the epilepsies or epileptic syndromes, representing a huge range of features and clinically distinct groups. In most cases, the exact cause is unknown. And that is why we need a research facility solely for this sad epidemic that is plaguing the world by storm.

Our facility will consist of researchers and scientists working hard on finding a cure for this disease. We will have professors that come on a weekly basis to always inform our researchers and scientists on new information and studies. We'd organize fundraisers for added budget to help with all the equipment this facility will hold. This facility will be located along the Garden Island of Michigan. It is separate from society and a perfect place for a research facility to prevent any possible outbreaks in the slight chance there ever will be one. This facility will indeed be hurricane and earthquake proof with many precautionary measures being taken while constructing this facility.
